

FIREFLYER HELICOPTER WATER TANK

OPERATING INSTRUCTIONS

FIRETAK Fireflyers can be deployed by a fire fighter in a couple of minutes by following these instructions.

1) Take Fireflyer and unscrew the 1 1/2” bolt in plug. Make sure all fittings are tight and shut off valve is closed.

2) Fill with water until overflow and replace plug until tight to make sure no air is able to be drawn in.

3) Turn the shut off valve to open, located on hose attached at base of tank, in order to start drawing water. You may open the 1 ½” bolt in cap to break suction in order to increase water flow.

EMPTYING FIREFLYER

1) Take off the hose at the base of the tank and unscrew the 1 1/2” bolt in plug and let hang to allow flow from the base.

2) Hang to dry.

3) When all water has been released, dry exterior of the tank.

5) Once Fireflyer is relatively dry, make sure to attach hose connection to the tank so that the Fireflyer is fully assembled for next field use.

AFTER USE

Like any other fire product, the Fireflyer should be cleaned after use. Washing with a mild soap and water is usually sufficient. AVOID solvent based cleaning agents. Check for damage and repair if required.
