

Hose splitters and water thieves

| The hose splitters with or without a shut-off valve allow for the complete control of the water flow when it is necessary to divide a hose line into two lines, or when two hose lines are combined into one.

They are made of aluminum alloy; they withstand tandem working pressures, and they are resistant to corrosion.

Water thieves are inserted into a hose line to draw water for various uses (e.g., feeding smaller hoses for fire suppression, sprinklers, filling backpack tanks, etc.). The shut-off system and the bypass hose are optional.
