

## *Self-supporting Tank*

- | Self-Supporting Tanks are easy to assemble and transport to store water for supply or direct combat in remote or hard-to-reach areas. In this way, they ensure the availability of large volumes of water without depending on tank trucks or where there is a low volume of replenishment.

The tanks are made of polyester fabric covered with PVC, and can be assembled with the necessary connections to connect motor pumps for loading or unloading. The upper opening allows to recharge Bambi Buckets.

Open tanks of smaller volume manage to autonomously remain in vertical position and can be replenished with any type of mobile tank or cistern, resulting in autonomy of performance.

- | Capacity: from 1.000 to 10.000 liters of storage.
